Intersect Milestone Acceptance Form

Milestone Acceptance Form (MAF)

Please complete this form once you have completed a milestone under your contract.

If you have an on-chain contract, please upload the completed form to the UI dashboard under the relevant milestone for review by Intersect's Delivery Assurance Team.

If you do not have an on-chain contract, please e-mail to billing@intersectmbo.org under the relevant milestone for review by Intersect's Delivery Assurance Team.

Project Name	*CTL*
Project Number	*OSC-26-0039*
Milestone Name(s) & Number(s)	*Milestone 1 – Basic Compatibility*
Milestone Description	
Bump runtime dependencies. Update the Nix flake and Spago dependencies to versions compatible with Protocol Version 11: Cardano Node (11.0.1 mainnet-ready release), Ogmios, Kupo. **Verify the test infrastructure.** Confirm that CTL's cardano-testnet-based local cluster still launches correctly against the updated node revision, and that all testing utilities work as expected. **Verify existing tests pass.** Run the full unit, integration, and end-to-end test suites. Investigate and fix any failures. Also confirm the Blockfrost backend does not regress, since CTL supports it as an alternative query layer.	
Acceptance Criteria Met	
### Acceptance Criteria 1 **Criteria:** Runtime dependencies are updated to versions compatible with Protocol Version 11, including Cardano Node 11.0.1, Ogmios, and Kupo. **Completion Statement:** Updated runtime dependencies: Cardano Node -> v11.0.1, Kupo -> v2.12.0, Ogmios -> v7.0.0, Blockfrost Backend RYO -> v6.7.0. CTL was updated with the changes necessary to remain functional across the van Rossem hard fork, unblocking projects that depend on it. The full Ogmios fixture set was regenerated, and multiple improvements were introduced to further improve test suite quality and coverage.

Verifiable Evidence:

https://github.com/Plutonomicon/cardano-transaction-lib/pull/1689

https://github.com/Plutonomicon/cardano-transaction-lib/pull/1687

Acceptance Criteria 2

Criteria: CTL's cardano-testnet-based local cluster launches successfully against the updated node revision, and the existing testing utilities continue to function as expected.

Completion Statement: The full test suite passes, including the integration tests that depend on cardano-testnet. Since cardano-testnet ships alongside cardano-node, several changes were required for compatibility with its latest version. CTL's testing framework now also accepts protocol parameters passed explicitly to cardano-testnet, which improves test reproducibility and transparency and lets users override individual parameters such as max execution units or max transaction size.

Verifiable Evidence:

https://github.com/Plutonomicon/cardano-transaction-lib/pull/1688

Video:
https://drive.google.com/file/d/1SHSO7h3qtdZefDU7B0pH9N7InFCjlTv9/view?usp=sharing
Note: this video serves as proof for both Milestone 1 acceptance criteria 2 and 3 — it demonstrates successful cluster launch and functioning testing utilities (criterion 2) as well as passing test output and non-regression of Blockfrost functionality (criterion 3).

Acceptance Criteria 3

Criteria: CTL's existing unit, integration, and end-to-end test suites pass against the updated dependency set, or any remaining failures are investigated, fixed, or explicitly documented as unrelated to Van Rossem compatibility.
Completion Statement: Updated the PureScript Cardano package set to v4.2.0, which includes an updated Blockfrost Provider package with adjusted Plutus cost model decoding. CTL now uses this package set version. CTL's existing unit, integration, and end-to-end test suites all pass against the updated dependency set. No test failures were encountered, so no further investigation, fixes, or exclusions were required.

Verifiable Evidence:

https://github.com/mlabs-haskell/purescript-cardano-package-set/commit/b9bb51888aebb905dd442ec7c5d527b7f02e12f3

https://github.com/Plutonomicon/cardano-transaction-lib/pull/1689/changes/3cb966d60af7be108117e6e3e89f263c65d29bf3

Quality & Testing
All existing tests pass, showing that existing functionality has not changed.
Public Communication Summary
CTL — the Cardano Transaction Library — is now compatible with the Van Rossem hard fork. MLabs updated CTL's runtime dependencies to Protocol Version 11 (Cardano Node 11.0.1, Ogmios and Kupo) and confirmed the full unit, integration and end-to-end test suites pass against the updated dependency set. This keeps CTL — and the many Cardano projects that build on it — current and stable as the network upgrades.
